

HONOURED

THE OATH — FEATURE SCOPE

V1.2 Milestone 2 — Developer Scope for Jimmy — Updated Sept 2026

Sign it. Keep it. Become it.

The Oath is a standing contract that moves and moulds around your life. The user chooses their days, a period and reminder times. Honoured checks each Oath day and stamps it HONOURED or BROKEN.

Core principle: Goals are signed commitments — not reminders.

1. Objective

Build a goal-setting and tracking system that lets users create scheduled activity commitments, sign them as contracts, receive a Wallet-styled Oath card with their signature on the lock screen at their morning and evening reminder times, and have progress verified against HealthKit data at the end of each Oath day.

2. Design Direction

The Oath is not a separate flow. It lives inside the existing Contract page. One new row replaces Standing Contract; tapping it opens a bottom sheet. Signing happens on the Contract page exactly as it does today.

Left: Contract page, Oath not set. Centre: The Oath sheet. Right: Oath set, ready to sign.

Colour system

- Gold is reserved for The Oath only: target icons, the gold Oath summary line and the status dot. Everything else is white (content and selection), grey (labels) or black.
- Selected days and period: white text with a hairline outline. Unselected: dim grey text with a faint grey hairline outline. No solid fills.
- Session count '17 sessions' in white; supporting lines in soft grey.
- Reminder icons (sun, moon): clean hairline line icons in grey.

Mockup notes — follow V1.04 for these elements:

- Buttons: SIGN THIS CONTRACT and SET THE OATH use V1.04's existing solid cream button style (mockup shows outlined buttons).
- Signature pad: disregard the signature pad sizing shown in the mockup — this is a mockup only. Keep the V1.04 signature pad exactly as it is: same size, dashed outline and CLEAR label. No X button.
- Existing fields (Activity, Target, Because, Deadline) keep their V1.04 layout and styling.
- The mockup is compressed to fit one screen. In the app the Contract page scrolls.

3. User Flow

Step	Action	Detail
1	Fill contract as usual	Activity, Target and Because fields — unchanged.
2	Tap The Oath row	Row sits where Standing Contract was. Subtitle: 'Give your dream a date with reality.'
3	Choose days	Seven day toggles, M T W T F S S. Selected days: white letters, hairline outline.
4	Choose period	Quick picks: 1 Week, 1 Month (default), 3 Months, 6 Months, 1 Year, Custom.
5	Set reminders	Morning and Evening toggles, each with its own time.
6	Read the live count	'You are committing to 17 sessions over 1 month. Make sure this is achievable.'
7	Tap SET THE OATH	Sheet closes. Oath row shows the Oath terms: days period.
8	Sign as usual	Finger signature, then the existing SIGN THIS CONTRACT button.
9	The Oath card	A Wallet-styled lock screen notification carrying the signed Oath: activity, target, the Because line and the signature. Scheduled on signing; appears at the morning and evening reminder times on every Oath day.

Step 9 — The Oath card. Left: morning at 07:00. Right: evening at 19:00 with live progress.

Step	Action	Detail
10	Each Oath day	Oath card appears on the lock screen at the morning reminder time, and again at the evening reminder time.
11	End of day check	At the deadline, HealthKit data pulled and compared to target.
12	Result	Day stamped HONoured or BROKEN. The Oath card shows the result briefly, then closes.

4. Functional Requirements

The Oath Row

- Replaces the Standing Contract checkbox. Standing Contract is removed as an option.
- One activity type per Oath contract. Numeric target set with the existing Target field (e.g. 33 min, 15,000 steps, 5 km).
- Unset state: target icon, 'The Oath', grey subtitle 'Give your dream a date with reality.', chevron.
- Set state: target icon, 'The Oath', gold summary line showing the Oath's terms only, e.g. 'Tue · Thu · Sat · Sun | 1 Month'. Reminder times are not shown — they are settings, not terms. Tap to reopen and edit before signing.
- Status pill reads 'OATH · UNSIGNED' when an Oath is set but not yet signed.

The Oath Sheet

- Bottom sheet over the dimmed Contract page, with grab handle. Header: target icon, 'The Oath', line 'Lock the days in. Take action.'
- Days: seven individual toggles. At least one day required.
- Period: minimum 2 days, maximum 1 year. Default 1 Month. Custom opens a picker within that range.
- Reminders: Morning toggle + time, Evening toggle + time. Fire on Oath days only. Either or both may be off.
- Toggles are a custom control (not the default iOS switch): ON = hairline outlined track with a solid white knob on the right; OFF = faint grey outlined track with a dim grey knob on the left.
- Affirmations rotate — one new affirmation per Oath day (e.g. Monday: 'You've got this', Wednesday: 'You're closer than you think'). Not all shown at once.

- Reminder times are set in the sheet and remain editable in Settings after signing (days, period and target stay locked).
- Live session count: number of selected days falling inside the period, recalculated on every change. Always visible — cannot be hidden or skipped.
- The count and 'Make sure this is achievable.' replace the separate commitment gate screen — no extra screen. Purpose unchanged: the user enters the commitment with full awareness, not impulse.
- SET THE OATH closes the sheet and saves the settings to the unsigned contract.
- Swipe down cancels with no Oath set. When an Oath is already set, the sheet shows a small 'Remove Oath' link.

Deadline

- Existing deadline field stays. With an Oath active, label reads 'DEADLINE (EACH OATH DAY)' and shows time only.
- That time is the daily cut-off on every Oath day. The period sets the end date.

Signing and Lock-in

- Signature and SIGN THIS CONTRACT button unchanged.
- Once signed, days, period and target are locked for the full period.
- Early exit is marked AMENDED — not HONoured or BROKEN. No day-by-day skipping.
- A new Oath after the period ends means signing again — no auto-renewal.
- User can view all active Oath contracts from the main Contract screen.

Verification

- At the deadline on each Oath day, pull the relevant HealthKit metric (builds on the V1.1 HealthKit layer) and compare to target.
- Stamp HONoured (target met) or BROKEN (not met). Non-Oath days are ignored.
- Handle HealthKit permission denial gracefully with a clear message.

The Oath Card — Lock Screen Notification

Not an Apple Wallet pass. Nothing is added to Wallet. The Oath card is a custom notification styled like a Wallet pass, carrying the user's signature, built as an iOS Live Activity.

See the Oath card mockup under User Flow, step 9.

- Appears on the lock screen on Oath days only — at the morning reminder time, and again at the evening reminder time. Silent on non-Oath days.
- Morning appearance runs through the morning. Evening appearance runs until the deadline, then shows the HONoured/BROKEN result briefly and closes. Each stays within Apple's Live Activity time limit.
- Row 1: gold infinity logo, 'The Oath', day and session count (e.g. 'TUE · 5 OF 17').
- Row 2: target and activity (e.g. '10,000 STEPS · Walking'). Evening shows progress against target with a thin gold bar (e.g. '6,240 / 10,000 STEPS').
- Row 3: the user's Because line in italics (e.g. 'Spring has begun, all life has sprung.').
- Row 4: the user's signature, the line of the moment and the deadline. Morning: the day's rotating affirmation (e.g. 'You've got this.'). Evening: remaining amount + 'Finish what you signed.'
- Style: black card, gold accents, serif title — matches the app. Final height must fit Apple's Live Activity size limit on the lock screen.
- Triggered by push-to-start from Supabase (scheduled job sends the start push at each user's reminder times on their Oath days). Requires iOS 17.2 or later.
- Evening progress requires background HealthKit updates. If not reliably achievable, the evening card shows the target without the progress bar — Jimmy to confirm.
- Fallback: users who turn off Live Activities, or are on iOS below 17.2, receive a standard push notification with the same text.

Weekly & Monthly Recap

- At the end of each week and month, Honoured displays a recap of the user's Oath performance.
- Shows totals Honoured, Amended and Broken for the period. Tone set automatically by the ratio.
- Strong week (e.g. 15 Honoured, 1 Broken): 'You slayed it this week.' Direct, celebratory, earned.
- Difficult week (inverted record): 'I believe in you even though this week has been challenging. Keep the dream alive and chase it. Let's start this week energized and use last week as kindle to start the flame.'
- Philosophy: pain is fuel. A broken week is never rubbed in — it is reframed as kindling for the next one. No manual input from the user.

- Even one Honoured session in a hard week is acknowledged: 'That's one more than zero.'

Existing Standing Contracts

- Contracts already signed as Standing Contracts run until they end. After this update only The Oath is offered.

5. Out of Scope (V1.2)

- Multiple simultaneous Oaths for the same activity type.
- Editing an Oath after signing.
- Custom affirmation text entered by the user.
- Social sharing of Oath progress. Streaks or reward mechanics.
- Word count tracker (separate milestone).
- Cross-device sync beyond the existing Supabase architecture.
- Apple Wallet pass (.pkpass) — replaced by the Oath card.

6. Indicative Effort

Workstream	Estimated Hours
Oath row (unset and summary states) + status pill	3–4 h
Oath sheet UI — days, period picker, reminders (custom toggles), live session count, remove link	6–9 h
Notifications — morning and evening, Oath days only, rotating affirmations	5–7 h
Deadline behaviour + lock-in on signing + AMENDED early exit	3–4 h
HealthKit end-of-day verification + HONOURED/BROKEN logic	5–7 h
Oath card — Live Activity UI (morning and evening layouts, result state)	4–6 h
Oath card — push-to-start + Supabase scheduled job at reminder times	6–9 h
Oath card — evening progress via background HealthKit updates	3–5 h
Weekly/monthly recap with tone-sensitive copy	3–4 h
Supabase — Oath storage, schedule persistence, daily results	4–5 h
Standing Contract removal + handling of existing contracts	1–2 h
Settings — edit reminder times after signing	2–3 h
Testing, edge cases, polish	4–5 h
Indicative total	49–70 h

7. Acceptance Example

- User fills a contract: Running, 33 minutes, 'Spring has started, it's warrior season.'
- Taps The Oath: Tue, Thu, Sat, Sun — 1 Month — Morning 7:00 am, Evening 8:00 pm. Sheet shows 17 sessions. Taps SET THE OATH.
- Row shows 'Tue · Thu · Sat · Sun | 1 Month'. Signs and taps SIGN THIS CONTRACT.
- On signing, the Oath card is scheduled for every Oath day of the month.
- Each Tuesday, Thursday, Saturday and Sunday at 7:00 am the Oath card appears on the lock screen with their signature and the affirmation 'You've got this.' At 8:00 pm it appears again with progress so far and 'Finish what you signed.' At 11:59 pm HealthKit is checked — 35 minutes stamped HONOURED, 20 minutes stamped BROKEN. The card shows the result, then closes.
- Monday, Wednesday and Friday: no reminders, no tracking.

Planning scope. Hours are estimates. Final estimate should follow Jimmy's review of this updated design and his technical review of notification capabilities and HealthKit integration points from V1.1 — confirm before locking the milestone on Upwork. Assumes the V1.1 HealthKit data layer is complete.
